Zoom Transcript Downloader

Quick Start · guided workspace baseline 2026.10

> **Privacy:** sign in on Zoom/SSO. The extension never asks for or stores your password. Scanning reads accessible transcript-list metadata only; transcript export begins only after you review and explicitly start a download.

1. Install and connect

1. Install from the Chrome Web Store direct listing (possibly private/unlisted). Edge can install it if other-store extensions are allowed.
2. The extension-owned workspace opens on first install. Later, open it using the extension toolbar button.
3. Enter your organization's Zoom subdomain; do not enter a password. Choose Recording transcripts, My Notes transcripts, or both.

2. Scan and review

1. Choose **Open Zoom and scan sources**. Both Zoom lists open/reuse in background tabs; sign in directly on Zoom/SSO if prompted.
2. The scan reads metadata only and does not export/download transcript content. Readiness waiting is bounded to two minutes. Stop cancels discovery.
3. Review both source lists. Incomplete scans block download. Exact shared identifiers may show reciprocal association badges; missing associations remain uncertain. Availability may be unknown until export.

3. Download

1. Select the source(s) to export and explicitly click **Download selected transcripts**.
2. Review per-source saved, unavailable, failed, and remaining results. Action needed means sign in on Zoom and restart that source; completed files remain.
3. Files are saved in Downloads under a dated folder with separate Recordings and My Notes subfolders. Existing files are preserved; conflicts get unique names.

My Notes refers to transcript files—not note text, AI summaries, or other meeting documents. The scope is the signed-in user's accessible items, not organization-wide.

Current full user guide · README. This printable quick-start matches the current guided workflow. Older screenshots may still show the legacy recordings-only panel.
