

Zoom Transcript Downloader

Quick start guide for version 2026.08

What it does

This extension saves Zoom transcript text files directly with clean final names such as `2026-08-14 - 1601 - Google CEP Setup and Deep Dive.txt`.

Use It

1. Open your Zoom transcript page in Edge or Chrome.
2. Click the **Zoom Transcript Downloader** extension icon.
3. If needed, click the gear icon to review settings.
4. Click **Save all available**.
5. Let the extension finish scanning all pages, then saving the transcripts.

Expected behavior: the extension uses a two-pass workflow. It scans first so it can plan the final filenames, then it goes back and downloads the files in order.

Recommended Settings

Filename pattern

Recommended default:

`{date} - {time} - {title}`

Save folder inside Downloads

Choose a clean subfolder under your normal Downloads folder.

Example: `Work/Zoom`

Include meeting ID

Usually leave this off. Turn it on only if you want the meeting ID added to every filename.

What You Should See

- The extension resets to page 1.
- It scans every transcript page.
- It then downloads available transcripts one by one.
- Unavailable or disabled transcript rows are skipped.

- Finished files appear in your Downloads subfolder with the final filename already applied.

Troubleshooting

- If nothing happens, refresh the Zoom transcript page and try again.
- If the run stops early, turn on **Show debug** and retry.
- If Zoom's list changes during the run, refresh and start over.
- If you want help or repo details, click the **?** icon in the extension.
